XM Radio provides local traffic and weather conditions to many of us that are going to travel to one of the locations that they provide information for when we would not be able to obtain that information from our starting location. For instance I drove to San Diego over a long weekend and would not have had any weather information for that area without my XM Radio, and as far as traffic information, I find that since I do not know where to find the information or even if I could receive it due to topographical interference, my XM Radio is an aid to local tourism and should be welcomed by the city officials. One of the most important things to remember, is that Satellite television providers such as DirecTV and Dish as well as local cable companies are required by law to provide local channels for certain areas, most of which are the same areas that XM Radio carries weather and traffic information for. How could you have different standards for services that provide entertainment and community services via the same media, satellite. If one service is changed, how will it affect the other service, radio and television.
